Project Title:

virtual agent-driven SLA breach awareness and justification system **Create**

Business Schedule:

Overview

Business Schedule is an important component of the **Backend Configuration and Data Setup Architecture** phase. It defines the organization's standard working days, working hours, holidays, and non-working periods. The **Virtual Agent-Driven SLA Breach Awareness and Justification System** uses the business schedule to accurately calculate SLA response and resolution times, ensuring that SLA measurements are based only on official business hours.

Steps Involved in Creating a Business Schedule

- 1. Define Working Days**
 - Configure the organization's working days (for example, Monday to Friday) according to business requirements.
- 2. Set Business Hours** ○ Specify the daily working hours, such as **9:00 AM to 6:00 PM**, during which SLA time calculations are active.
- 3. Configure Time Zone**
 - Select the appropriate time zone to ensure accurate scheduling and SLA calculations across all users.
- 4. Add Holidays** ○ Configure public holidays and company-specific holidays so they are excluded from SLA calculations.
- 5. Define Non-Working Hours** ○ Specify weekends, holidays, and after-business hours as non-working periods.
- 6. Associate the Schedule with SLAs**

- Link the business schedule to SLA definitions so response and resolution times are calculated based on the configured schedule.

7. Validate the Schedule

- Test the business schedule to ensure SLA timers start, pause, and resume correctly according to business hours.

Benefits of Creating a Business Schedule

- Ensures accurate SLA response and resolution time calculations.
- Excludes weekends and holidays from SLA timing.
- Improves the accuracy of SLA breach detection.
- Supports consistent and reliable SLA monitoring.
- Reduces false SLA breach notifications.
- Aligns SLA calculations with the organization's working calendar.
