Create Required Incident Fields – SLA Justification Fields

Date	
Project name	virtual agent-driven SLA breach awareness and justification system
Team ID	SWTID-2026-4945
Maximam Marks	

Project Title: virtual agent-driven SLA breach awareness and justification system **Create Required Incident Fields – SLA Justification**

Fields:

Overview

Creating **SLA Justification Fields** is an important activity in the **Backend Configuration and Data Setup Architecture** phase. These custom fields are added to the Incident table to capture the reason, category, and supporting information whenever an SLA breach occurs. The collected information helps the **Virtual Agent-Driven SLA Breach Awareness and Justification System** analyze SLA violations, generate meaningful justifications, and improve reporting and decision-making. **Steps Involved in Creating SLA Justification Fields**

1. Identify Required Fields

- Determine the information required to justify SLA breaches, such as justification reason, breach category, root cause, approval status, and remarks.

2. Create Custom Incident Fields

- Add new fields to the Incident table to store SLA justification details without affecting existing incident records.

3. Define Field Types

- Configure appropriate data types for each field, such as **Choice**, **String**, **Reference**, **Date/Time**, or **Multi-line Text**, based on the information being captured.

4. Configure Field Properties

- Set field labels, default values, mandatory status, and visibility according to business requirements.

5. Add Fields to the Incident Form

- Place the newly created SLA justification fields in the appropriate section of the Incident form for easy access by users.

6. Apply Access Control

- Configure role-based permissions so that only authorized users can view or update the SLA justification fields.

7. Test the Configuration

- Create sample incidents and verify that the fields are displayed correctly, accept valid data, and are stored successfully in the database.

Example SLA Justification Fields:

Field Name	Purpose
SLA Justification	Records the explanation for the SLA breach.
Breach Category	Identifies the type of SLA violation.
Root Cause	Specifies the primary reason for the breach.
Delay Reason	Describes the factor that caused the delay.
Justification Status	Indicates whether the justification is Pending, Approved, or Rejected.
Approved By	Stores the name of the approving manager.
Approval Date	Records the date and time of approval.
Additional Remarks	Allows users to enter extra comments or supporting information.
