

Notification Configuration Using Flow Designer and UI Policy

create a flow for notification

Date	
Project name	virtual agent-driven SLA breach awareness and justification system
Team ID	SWTID-2026-4945
Maximam Marks	

Project Title:

virtual agent-driven SLA breach awareness and justification system **Create a**

Flow for Notification:

Steps Involved in Creating a Notification Flow

1. Create a New Flow

- Open Flow Designer and create a new flow with a suitable name such as "**SLA Breach Notification Flow**".

2. Define the Trigger

- Configure the trigger to start the flow when an incident meets specific SLA conditions, such as an SLA breach or an SLA nearing its deadline.

3. Set Flow Conditions

- Define conditions to determine when notifications should be sent, based on incident priority, SLA status, or breach level.

4. Configure Notification Actions

- Add actions to send notifications through email, system alerts, or other communication channels to the assigned user, support team, or manager.

5. Customize Notification Content

- Include important details such as Incident Number, Priority, Assigned Group, SLA Status, Breach Time, and Recommended Actions in the notification message.

6. Add Escalation Logic

- Configure escalation notifications to higher-level managers if the incident remains unresolved after a specified period.

7. **Test the Flow**

- Create sample incidents and verify that notifications are triggered correctly when SLA conditions are met.

8. **Activate the Flow**

- Publish and activate the flow so that it automatically executes whenever the defined trigger conditions occur.

Benefits of Creating a Notification Flow

- Provides real-time alerts for SLA breaches.
- Reduces manual monitoring effort.
- Improves response and resolution times.
- Ensures timely communication among stakeholders.
- Supports proactive SLA management.
- Enhances service quality and customer satisfaction.

Outcome

The **Notification Flow** automatically monitors SLA conditions and sends timely alerts to relevant users whenever an SLA is at risk or breached. This ensures that incidents receive immediate attention, supports proactive issue resolution, and helps the **Virtual AgentDriven SLA Breach Awareness and Justification System** maintain SLA compliance and operational efficiency.
