Project Title:

virtual agent-driven SLA breach awareness and justification system **UI**

Policy Configuration:

UI Policy Configuration is an important activity in the **Notification Configuration** phase of the **Virtual Agent-Driven SLA Breach Awareness and Justification System**. It is used to dynamically control the behavior of fields on the Incident form based on predefined conditions, ensuring that users provide the necessary information when an SLA breach occurs. A UI Policy is created for the Incident table and configured to execute whenever the SLA status changes to **Breached** or **At Risk**. Based on these conditions, the policy automatically makes the **SLA Justification**, **Breach Category**, **Root Cause**, and **Additional Remarks** fields visible and mandatory, ensuring that users cannot submit or update the incident without providing valid justification details. The policy can also make certain fields read-only when required to prevent unauthorized modifications. Reverse actions are enabled so that when the SLA status changes back to a normal state, the fields automatically return to their default behavior. After configuring the policy, it is thoroughly tested using sample incidents to verify that all field actions work correctly. Once validated, the UI Policy is activated, allowing it to automatically enforce data entry rules during incident management. This configuration improves data accuracy, reduces manual errors, ensures consistent collection of SLA justification information, and enhances the overall efficiency of SLA breach management and notification processing.
