

Virtual Agent Design and Configuration

Configure Virtual Agent

Date	
Project name	virtual agent-driven SLA breach awareness and justification system
Team ID	SWTID-2026-4945
Maximam Marks	

Project Title:

virtual agent-driven SLA breach awareness and justification system **Configure**

Virtual Agent:

Step 1: Open Virtual Agent Designer

Log in to the ServiceNow instance with administrator privileges and navigate to **Conversational Interfaces → Virtual Agent → Designer** to access the Virtual Agent configuration workspace.

Step 2: Create a New Virtual Agent Topic

Create a new Virtual Agent topic with an appropriate name, such as **"SLA Breach Awareness and Justification"**, and provide a brief description of its purpose.

Step 3: Define Conversation Flow

Design the conversation flow by adding greeting messages, user prompts, decision nodes, and response messages. Configure the sequence of interactions that the Virtual Agent will follow when communicating with users.

Step 4: Configure User Inputs

Define the information that the Virtual Agent should collect from users, such as **Incident Number, SLA Status, Priority, Assigned Group, and Justification Details**.

Step 5: Integrate with Backend Data

Configure the Virtual Agent to retrieve incident and SLA information from the backend using tables, records, or Flow Designer actions. This enables the chatbot to provide realtime SLA details.

Step 6: Configure Automated Responses

Set up automated responses for common user queries, including SLA status, remaining resolution time, breach notifications, and justification requests.

Step 7: Add Decision Logic

Configure conditional logic so that the Virtual Agent responds differently based on SLA status. For example, if an SLA is **At Risk** or **Breached**, the agent can request justification details and provide appropriate guidance.

Step 8: Connect with Notification Flow

Integrate the Virtual Agent with the notification flow so that it can notify users about SLA breaches and guide them through the justification process.

Step 9: Test the Virtual Agent

Run multiple test conversations using sample incidents to verify that the Virtual Agent correctly retrieves SLA information, responds to user queries, and follows the configured conversation flow.

Step 10: Publish and Activate the Virtual Agent

After successful testing, publish and activate the Virtual Agent so that it becomes available to end users for interacting with the **Virtual Agent-Driven SLA Breach Awareness and Justification System**.
